If your horse maintains weight easily (or too easily!) on forage alone, a balancer is the ideal way to provide essential nutrients without excess calories. However, with so much choice available, we know that deciding which balancer is right for your horse can sometimes feel like a bit of minefield. If this sounds familiar we hope following tips help to point you right direction...

1. Consider which, if any functional ingredients may be most beneficial for your horse. If you are simply looking to provide nutrients to balance a forage based diet, look for a balancer without added bells and whistles such as joint and digestive support.
2. If your horse or pony is on restricted forage or fed straw as a partial forage replacer,

look for a balancer that is high in lysine. Lysine is considered the most important essential amino acid (building block of protein) and plays a key role in supporting muscle and topline. If protein and lysine requirements are not met, the body will break down lean tissue (muscle) to meet demand. In addition to compromising topline, burning muscle instead of fat slows metabolism.

3. If you are competing look for a balancer that is BETA (British Equestrian Trade Association) NOPS (Naturally Occurring Prohibited Substances) approved. A naturally occurring prohibited substance is one that is either naturally present in certain ingredients or one that occurs as a result of inadvertent cross contamination e.g. during the growing, storage or transport of ingredients or during the manufacturing process. Members of the BETA NOPS assurance scheme must comply with and be audited against a strict code of conduct which requires them to evaluate the risk of contamination during every step of the manufacturing process 'from field to sack'. Look for the BETA NOPS approval mark on pack.
4. Choose a stud balancer for mares in late gestation (introduce gradually in month 8), lactating mares, foals and yearlings.
5. Look for balancers without added iron. Forage is naturally high in iron and typically exceeds requirements, even for horses on restricted rations. As iron is one of the few minerals that can be harmful at relatively low levels, it's sensible to avoid any unnecessary excess intake.
6. When looking at the nutritional analysis remember that percentages only tell part of the story. For example, when fed at the recommended amount, balancers contribute minimal amounts of starch and sugar to the total diet. A balancer with a combined starch and sugar content of 15% will contribute just 75g of starch and sugar to the total diet when fed at 500g per day – in comparison, 3kg of feed with a combined starch and sugar content of 5% will contain 150g of starch and sugar (which is still very low). Did you know a 250kg pony turned out 24/7 may consume almost 2kg of simple sugars from grass alone?!
7. Balancers are not 'conditioning'. Due to the low feeding rate, all balancers (except stud balancers), provide minimal calories when fed at the recommended amount. In fact, the recommended ration of balancer is approximately 5-6 times lower in calories than recommended ration of 'low calorie' mix/ cubes. If your horse needs additional calories, look for suitable compound feed, fibre or mash containing added vitamins and minerals.
